

Package: cld2 (via r-universe)

December 2, 2024

Type Package

Title Google's Compact Language Detector 2

Version 1.2.5

Description Bindings to Google's C++ library Compact Language Detector 2 (see <<https://github.com/cld2owners/cld2#readme>> for more information). Probabilistically detects over 80 languages in plain text or HTML. For mixed-language input it returns the top three detected languages and their approximate proportion of the total classified text bytes (e.g. 80% English and 20% French out of 1000 bytes). There is also a 'cld3' package on CRAN which uses a neural network model instead.

Description

The function `detect_language()` is vectorised and guesses the the language of each string in text or returns NA if the language could not reliably be determined. The function `detect_language_multi()` is not vectorised and analyses the entire character vector as a whole. The output includes the top 3 detected languages including the relative proportion and the total number of text bytes that was reliably classified.

Usage

```
detect_language(text, plain_text = TRUE, lang_code = TRUE)
```

```
detect_language_mixed(text, plain_text = TRUE)
```

Arguments

<code>text</code>	a string with text to classify or a connection to read from
<code>plain_text</code>	if FALSE then code skips HTML tags and expands HTML entities
<code>lang_code</code>	return a language code instead of name

Examples

```
# Vectorized function
text <- c("To be or not to be?", "Ce n'est pas grave.", "Nou breekt mijn klomp!")
detect_language(text)

## Not run:
# Read HTML from connection
detect_language(url('http://www.un.org/ar/universal-declaration-human-rights/'), plain_text = FALSE)

# More detailed classification output
detect_language_mixed(
  url('http://www.un.org/fr/universal-declaration-human-rights/'), plain_text = FALSE)

detect_language_mixed(
  url('http://www.un.org/zh/universal-declaration-human-rights/'), plain_text = FALSE)

## End(Not run)
```
